                                                                                                                                             This sequence represents the light chain of the chimeric 3B9 antibody of the invention. The antibody is a chimeric or Munanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease.

and variable framework region from human acceptor Ig LC or HC sequence. The invention is useful for preventing or treating an amyloidogenic disease or Alzheimer's disease in a patient. The invention is also useful for in vivo imaging amyloid deposits in a patient. The present amino acid sequence represents a mouse 3D6/10D5 variable light (VL) chain or variable heavy (VH) chain protein of the invention.

This is the amino acid sequence of the mature peptide from the murine anti-protein C monoclonal antibody HPC-4 heavy chain variable region. HPC-4 recognises the activation peptide region (AAR88106) of the heavy chain of protein C, a vitamin K-dependent plasma protein zymogen. Protein C is converted to activated protein C (APC) by cleavage between HPC-4 prevents protein C activation peptide sequence. HPC-4 prevents protein C activation the activation peptide sequence. The DNA sequences encoding the variable regions of the heavy and light chains of the antibody (AAT09229-302) were used to construct humanised antibodies using the PCR primers AAT09303-9. The humanised antibodies are useful as inhibitors of coagulation and can be used for the treatment of tumours by inhibiting the anticoagulant activity of APC by preventing

has the sequence RIGPGR or RVGPGR in the principal neutralising domain. The antibody may be used to neutralise the clinically separate strains which cannot be neitralised by the neutralising antibodies against IIIB and IIIMN strains.
                                                                                                                                                                                                                                                                                                                                       ٠<u>.</u>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the amino acid sequence of the heavy chain variable region from the murine anti-protein C monoclonal antibody HPC-4 which recognises the activation peptide region (ARR8106) of the heavy chain of protein C, a vitamin K-dependent plasma protein zymogen. Protein C is converted to activated protein C (APC) by cleavage between the Arg-Leu amino acid contained within the activation peptide sequence. HPC-4 prevents protein C activation to APC by binding to this region. The DNA sequences encoding the variable regions of the heavy and light chains of the antibody (AAT09299-302) were used to construct humanised antibodies using

The gene was amplified by primers (AAQ75876-87) from cDNA derived from mRNA from mouse SK2 hybridoma cells. The fragment was cloned into plasmid pUC19 to produce plasmid pUC-SK2-Vh. The inserted fragment is used to

3
generate constructs (see AAQ75914-7) encoding fragments of an antibody to the human IL-6 comprising (a) a light chain with (i) a variable region containing 3 complementarity determining regions (CDR) (AAR77201-3) inserted into several framework regions (FR) (AAR77204-7) and (ii) a human light chain constant region and (b) a heavy chain with (i) a variable region containing 3 CDR (AAR77212-4) inserted into an FR (AAR77215-8) and (ii) a human light chain constant region. The FR of the light chain may be mouse derived (AAQ75889) or from the human antibody REI. The heavy chain FR may also be mouse derived (AAQ75889) or from the human antibody chain antibodies can be used in the treatment of IL-6 relamed
                                                                                                                                                                                   disorders. The antibodies are useful as they have low antigenicity due to the use of human derived sequences and low antigenicity mouse derived
                                                                                                                                                                                                                                                                                                                                                                                           1 QVTLKESGPGILQPSQTLSLTCSFSGFSLSTSGMGVSWIRQPSGKGLEWLAHIYWDDDKR 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel herbicide binding protein which can confer herbicide resistance activity. Crop plants, such as soybean, cotton, tobacco, sugarbeet, oilseed rape, canola, flax, sunflower, potato, tomato, alfalfa, lettuce, maize, wheat, sorghum, rye, bananas, barley, oat, turf grass, forage grass, sugar cane, pea, field bean, rice, pine, poplar, apple, grape, citrus or nut plants, transformed with a herbicide binding protein gene are resistant to the herbicide. Hence, weeds can be selectively controlled in a field of the transformed crops. The plants are substantially resistant or tolerant to herbicides such as paraquat or diquat, that inhibit photosynthesis by accepting
                                                                                                                                                                                                                                                                                          S

raising, in an infected individual, an antibody able to bind to the hypervariable 1 (HVR1) region of the envelope protein E2 of the infecting HCV strain. The different groups of peptides are administered sequentially to raise antibodies, helper T-lymphocytes, and cytotoxic T-lymphocytes which are cross-reactive to the HVR1 region of the infecting HCV. The vaccines are useful for preventing and treating chronic HCV infections. ABG67186-ABG67189 represent variable regions of human IgG1 antibody heavy chain.
                                                                                                                                                                                                                                                        4,

```
lipid peroxidation or by blocking electron transport in photosystem II. The herbicide binding proteins advantageously sequester the herbicide, e.g. at the cell surface or in the vacuoles of a treated plant. Sequestration at the cell surface prevents the entry of the herbicide into the cells or that the herbicide cannot reach its intracellular target and exert any significant cytoxic effect. The herbicide binding protein inhibits the mobility of the herbicide from the application site to the whole plant preventing the herbicide reaching particularly sensitive organs. Additionally, tolerant plants can be produced against herbicides that have more than one target site.
      electrons from photosystem I thus generating free radicals which cause

Ig heavy chain precursor V-II region (Cess) - human C.Species: Homo sapiens (man)
C.Species: Homo sapiens (man)
C.Accession: A02090
R.Takahashi, N.; Noma, T.; Honjo, T.
Proc. Natl. Acad. Sci. U.S.A. 81, 5194-5198, 1984
A.Title: Rearranged immunoglobulin heavy chain variable region (V-H) pseudogene that del A.Reference number: A02090; MUID:84298107; PMID:6089186

A;Molecule type: mRNA A;Residues: 1-147 <TAK> A;Note: the sequence was determined from the differentiated gene A;Note: the authors translated the codon GGG for residue 16 as Trp, TGG for residue 142 as Ser, and CAG for residue 147 as Ser C;Genetics:

Gene: GDB:IGHV@

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
